THE
PREFACE.

THE Bufinefs of refolving *Ad-fected Quadratic, Cubic,* and *Biquadratic Equations,* by the common Methods, is look'd upon to be very tedious, difficult, and troublefome ; therefore an eafier and fhorter Way of unravelling fuch Sort of *Equations,* would undoubtedly claim the Regard of the *Publick.* This (I hope) is fufficiently performed in the following *Treatife,* which contains fo general and explicit a Method, as to be applicable to whatever Cafes might happen in each Kind; and yet it is fo eafy in Practice, that no Perfon (if but a little acquainted with *Logarithmetical Arithmetic*) will ever be at a Lofs to underftand it : In fhort, 'tis an entire new, and concife

Way,

Way of Solving *Adfected Equations*
of the Second and Third *Powers*, by
the Mediation of which, and the
Method given in Dr. SAUNDERSON's
Algebra, Vol. II. p. 735. (of DES
CARTES's Invention) the Fourth be-
comes soluble.

This new Method and Tables, was
one of the Discoveries of my late inge-
nious Friend Mr. ANTHONY THACKER,
Teacher of the Mathematics at *Bir-
mingham Free-School*, a Person well
known to the Mathematicians of this
Nation for his great Genius, and many
surprizing Performances, in this Kind
of Literature; who engaging himself
in the Publication of three Volumes
of Mathematicks, the first of which
he printed in 1743, was in *March*
1744, seiz'd with a violent Fever,
which baffled the Art of the Physi-
cians, and hurried him out of this
Life, before he had half finish'd his
second Volume; but had he lived,
this Work would have been much
                              better

better done, and placed, as he intended, in his Third:

At his Death many of his Papers coming into my Hands by his Defire, I fet about to calculate the Remainder of thefe Tables, moft of which I had done in his Life-time.

Some of the Examples, and the Demonftrations, I collected from his Papers, and have endeavour'd to make every Thing as correct and intelligible as poffible; but if thro' Inadvertency any little Miftake fhou'd occur to the *Reader*, as no Body has fupervis'd this Work after me, I hope he will correct it with his Pen, and candidly pafs it by.

In the laft Place, I have applied thefe *Tables* to the Solution of two geometrical Queftions, *viz*. the fixth Queftion propofed in the laft Year's *Gentleman's Diary*, and the Seventh *Prob*. of WARD's *Introduction to the Mathematics*, p. 326. of the third Edition, which laft is there folv'd by a

Cubic

Cubic Equation ; but by means of these *Tables* such Questions (where the Sum of the Hypothenuse, added to either Side, or the Difference betwixt the Hypothenuse and either Side, and the Area of any right-angled Triangle are given) will be solv'd by a simple *Equation.*

I must beg Leave here to acquaint the *Publick,* that I have now ready for the Press, a Treatise on *Fluxions*; wherein the Doctrine of that sublime *Art,* will be treated in a plain and familiar Way, which will contain several new *Theorems* of Mr. THACKER's never before publish'd, and the Demonstrations of those, particular Two, *viz.* for finding the *Area* of the *Hyperbola,* and *Circle's Segment* ; which, the * *Author* of a most ingenious *Piece* says, depend on Principles not yet publickly known, till the *Inventor* shall think fit to publish them.

* Mr. *Shirtcliffe.*

CLEOBURY,   W. BROWN.

A NEW
METHOD
Of Solving
Adfected, Quadratic, Cubic, and Biquadratic Equations.

T HE READER is here supposed to understand the Nature of *Equations* in general, such as their Generation, the Number of their Affirmative and Negative Roots, and the common Methods of transforming them; which being known, he will be the better prepar'd to comprehend this new Method of their Solution.

CHAP. I.

Of the Resolution of Quadratic Equations.

H E R E are three *Cases*; first, when the Equation to be resolved is in this Form, $a^2 + 2ba = c$; secondly, when it is in this Form, $a^2 - 2ba = c$; and thirdly, when it is in this Form, $2ba - a^2 = c$.

B   CASE

CASE I.

To find the Value of a *in* $a^2 + 2ba = c$?

SOLUTION.

ASSUME $a^2 + 2ba = c^2$, and find the Value of $\frac{rc}{b}$ = the Difference of the Logarithm of half the Co-efficient of *a*, taken from half the Logarithm of the absolute Number *cc*, added to Radius, in the Tables of Logarithm Tangents; and let the Tangent of half the Number of Degrees corresponding thereto, be express'd by $\frac{x}{y}$; then will $rc \times \frac{x}{y} = \frac{\frac{rc}{x}}{y}$ which is the Logarithm Co-tangent of $\frac{x}{y}$ subtracted from the Logarithm of *rc* be = the Value of *a*.

EXAMPLE.

Let there be given $a^2 + 7a = 144$, or $a^2 + 2ba = c^2$ to find *a*? Here half the Logarithm of 144 + Radius is $rc = 10 + 1.0791812$; and the Logarithm of half 7 is $b = 0.5440680$ and 11.0791812 Minus 0.5440680 is $= 10.5351132 = \frac{rc}{b}$ which found in the Tables of Logarithm Tangents is 73° : 44' : 23'' : 15''', the Logarithm Co-tangent of whose half is 10.1249390, which taken from 11.0791812 leaves 0.9542422 = Logarithm of *a*, ∴ *a* = 9. Q. E. I.

CASE

CASE II.

To find the Value of a in a² — 2ba=c ?

SOLUTION.

PUT $a^2 - 2ba = c^2$, and find as before in Case I. the Value of $\frac{rc}{b}$ in the Tables of Tangents, and let the Co-tangent of half the Number of Degrees opposite thereto be $\frac{y}{x}$, then will $rc \times \frac{y}{x}$ which is = Logarithm Tangent of $\frac{y}{x}$ subtracted from the Logarithm of rc be = a.

EXAMPLE.

Given $a^2 - 7a = 120$, or $a^2 - 2ba = c^2$, Quere a? Here the Logarithm of half 7 is =0.5440680, which subtracted from half the Logarithm of 120 + Radius = 11.0395906, leaves 10.4955226; this answers in the Tables of Tangents to 72° : 16′ : 51″ : 40‴, the Tangent of half which is 9.8634991, and this taken from 11.0395906, gives 1.1760915 = Logarithm of a ∴ a= 15. Q. E. I.

CASE III.

To find the Value of a in 2ba — a²=c ?

SOLUTION.

HERE put $2ba - a^2 = c^2$, and find the Value of $\frac{rc}{b}$ in the Tables of Sines, and let the Co-

B 2tangent

tangent of half the Number of Degrees correspon-
dent be called $\frac{y}{x}$; then will $rc \times \frac{y}{x}$, as in the last Case,
be $= a$.

EXAMPLE.

Given $25a - a^2 = 136$, or $2ba - a = c^2$. Quere the
Value of a? Now the Logarithm of Half 25 is
$= 1.0969100$ which subtracted from half the Loga-
rithm of 136 + Radius = 11.0667694, leaves
9.9698594; this answers in the Tables of Sines to
$68° : 53' : 59'' : 12'''$ or $111° : 6' : 0'' : 48'''$; the
Tangents of whose Halves are 9.8363202 and
10.1636798, and each of these subtracted from
11.0667694, gives 1.2304492 and 0.9030896
$=$Logarithms of a, $\therefore a = 17$ or 8. Q. E. I.

COROLLARY.

By a just Observation of the Premises, may be
deduc'd this short Rule for solving all Quadratic
Equations.

From half the Logarithm of c + Radius $(=L)$
subtract the Logarithm of b, find the Difference
in the Tables of Logarithm Tangents, if the
given Equation be of the 1st or 2d Form; or in
the Tables of Sines, if of the 3d, then subtract, if
the Equation be of the 2d or 3d Form, the Loga-
rithm Tangent of half the corresponding Number
of Degrees (or the Co-tangent of half the Degrees, if
it be of the 1st) from L above, and the Remainder
will be the Logarithm of a sought. See the Forms,
p. 1.

Having found the one Value of a, the other is
easily obtain'd from a due Consideration of the Ge-
nesis of Quadratics, whereby it appears that
the Sum of both the Roots must ever be $=$ to $2b$:

For

For Inftance, the two affirmative Values of *a* in the 3d *Cafe*, are 17 and 8, whofe Sum is 25 =2*b* ∴ by having the one of them, the other is got by Subtraction. But then this Sum of them in the 1ft and 2d *Cafe*, will always be affected with a contrary Sign to 2*b* ∴ by fubtracting the affirmative found Value in either of thefe Cafes from 2*b* with a contrary Sign to what is in the given Equation, the Remainder will be the negative Value required. Thus in *Cafe* 2d the affirmative Value of *a* is found =15, and 2*b* is =—7 ∴ +7—15 is =—8 the negative One. And fo in *Cafe* 1. the affirmative Root of *a* is =9, and 2*b* is =+7 ∴ —7 —9=—16 the negative One.

The Demonftration of the foregoing Cafes.

IN the right-angled Triangle *A* *CB*, right-angled at *C*, let the Perpendicular *CP* be drawn from the Right-Angle upon the Hypothenufe *AB*: Then put $c = CP$, $2b =$ the Difference betwixt *AP* and *PB*, and let *PB* be made $=$ to *a*, then *per* fimilar Triangles $AP : PC :: PC : PB$; that is, $2b + a : c :: c : a$ ∴ $a^2 + 2ba = c^2$. But if *x* and *y* be put for the Sine and Cofine of the Angle *BAC* or *PCB*, and Radius $= 1$, then *per* Trigonometry $x : c :: y : \frac{cy}{x}$ $= AP$, and alfo $y : c :: x : \frac{cx}{y} = PB$, but $PA - PB$ $= 2b = \frac{cy}{x} - \frac{cx}{y}$ ∴ $cy^2 - cx^2 = 2byx$, and $\frac{rc}{b} = \frac{2ryx}{y^2 - x^2}$ (*r* being $=$ Radius) is the Tangent of an Arch double to that of the Angle *BAC* or *PCB*, which being

being known, then (as above) $PB = cx\frac{x}{y}$, or rather

$rcx\frac{x}{y} = a$, which is the *Demonstration* to *Case* 1.

Again, if a be put to express the Segment AP, then by Computation $a^2 - 2ba = c^2$; but $\frac{rc}{b}$ is still $= \frac{2ryx}{y^2 - x^2}$, which being known, $AP = rcx\frac{y}{x} = a$, which demonstrates the 2d *Case*.

Lastly, If b be put to express the whole Base AB, and a represents either AP or PB, then by Calculation $ba - a^2 = c^2$. And since $AP = \frac{cy}{x}$, and $PB = \frac{cx}{y}$, hence $\frac{cy}{x} + \frac{cx}{y} = b = AB$, $\therefore cy^2 + cx^2 = byx$, or (because $y^2 + x^2 = 1$) it is $c = byx$ or $rc = rbyx$, and $\frac{2rc}{b} = 2ryx$ the Sine of an Arch, which is double to that of the Angle BAC or PCB, which being known $rcx\frac{y}{x}$ will be $= PA$ or PB, which is the Demonstration to *Case* 3d. And since the Sine of an Arch, and that of its Supplement are the same, this *Case* will be ambiguous.

CHAP. II.

Of the Resolution of Cubic Equations.

CUBICS are most easily solved by the help of the new *Tables* hereto annex'd, whose Theory is given further on, and whose Practice will be sufficiently shewn in the following *Cases*.

CASE

CASE I.

To find the Value of a in a³—ba=c ?

SOLUTION.

ASSUME a³—ba=2c, and find the Value of $\frac{rb\sqrt{b}}{c}$ = Logarithm of c subtracted from half the Logarithm of b, added to the Logarithm of b, Plus Radius in the Tables under the Title of x³—bx=2c, and let the Tangent of the opposite Number of Degrees be called t, then will $\frac{r\sqrt{b}}{t}$ = Logarithm Tangent of t, taken from half the Logarithm of b Plus Radius be equal the Value of a.

EXAMPLE.

Given a³—148a=672, or a³—ba=2c, to find a? Here c=336, and b=148, whose Logarithms are 2.5263393 and 2.1702617, half of which laſt is 1.0851308 = $\sqrt{b}$. ∴ rb = 12.1702617 and 12.1702617 Plus 1.0851308 Minus 2.5263393 is = 10.7290532 = $\frac{rb\sqrt{b}}{c}$, to which anſwers 40° 59' the next leaſt in the Tables of x³—bx=2c, but to find it more exact, proceed thus ; divide half the Difference betwixt the Number to be ſought for in the Tables and the next leaſt to it, = here to 4347.5 by the Difference betwixt the Numbers correſponding to 40° : 59' and 40° : 59' : 30' = 11691, and the Quotient .3718 is the Decimal of a Minute = 22' : 20'' over and above to be added

to

to 40° : $59'$ (or subtracted from the greater oppo-
site Degrees when the Tabular Numbers decrease); then will the Logarithm Tangent of which be
9.9390028, which taken from $11.0851308 = r\sqrt{b}$
leaves $1.461280 = \dfrac{r\sqrt{b}}{t} = $ Logarithm of a, $\therefore a =$
14, one of its Values, which is Affirmative.

But in order to find the Negative Values of a
the Number 10.7296532 before found under $x^3 - bx$
$= 2c$, must now be fought for under $bx - x^3 = 2c$ in
the Tables, which gives 26° : $15'$: $8''$: $37'''$, and
also 33° : $19'$: $43''$: $30'''$, whose Tangents are
9.6930205, and 9.8179590, each of which added
to 10851308 Minus Radius $= \dfrac{t\sqrt{b}}{r}$ (see the follow-
ing *Case*) will exhibit the Logarithms of 0.7781513,
and 0.9030898, $= 6$, and 8, for the two Nega-
tive Values of a. $\therefore a = +14$, -8, or -6, for
$\overline{a - 14 \times a + 8 \times a + 0} = a^3 - 148a - 672 = 0$, the given
Equation. Q. E. I.

I have been the longer about this first *Case's Ex-
ample*, in order to make every Thing as plain as
possible to the *Reader*.

C A S E II.

To find the Value of a *in* ba $- a^3 = c$?

S O L U T I O N.

PUT $ba - a^3 = 2c$, and finding the Value of
$\dfrac{rb\sqrt{b}}{c}$ in the Tables under the Title of
$bx - x^3 = 2c$, we get the Number of Degrees cor-
responding

ponding whose Tangent call t, then will $\dfrac{t\sqrt{b}}{r}$ be $=$ the Value of a.

EXAMPLE.

Given $364a - a^3 = 2640$, or $ba - a^3 = 2c$. Quere a? Here the Value of $\dfrac{rb\sqrt{b}}{c} = \dfrac{r26\sqrt{364}}{1320} = 10.7210782$, is to be sought for in the Tables of $bx - x^3 = 2c$, against which is found $27° : 39' : 39'' : 20'''$, and also $32° : 10' : 07'' : 20'''$, whose Logarithm Tangents call t, and T, then will the Logarithm of $\dfrac{t\sqrt{364}}{r} = 0.9999999$ and $\dfrac{T\sqrt{364}}{r} = 1.0791813$, which answer in the Tables of Logarithms to 10, and 12, be the two Affirmative Values of a. And if the above Number 10.7210782, be found in the Tables of $x^3 - bx = 2c$, we shall find it $= 40° : 55' : 56'' : 39'''$, whose Tangent call t, then as in Case I. will the Logarithm of $\dfrac{r\sqrt{b}}{t} = \dfrac{r\sqrt{364}}{t} = 1.3424227$, which answers in the Tables of Logarithms to 22, be the Negative Value of a, $\therefore a = +10, +12$, or -22 for $\overline{a - 10} \times \overline{a - 12} \times \overline{a + 22} = a^3 - 364a + 2640 = 0$, the given *Equation*. Q. E. I.

CASE III.

To find the Value of a *in* $a^3 + ba^2 = c$?

SOLUTION.

ASSUME $a^3 + ba^2 = 4c^2$, find the Value of $\dfrac{rb\sqrt{b}}{c}$

C   in

in the Tables under $x^3 - bx = 2c$, as in *Case* I. and call the Tangent of the correspondent Number of Degrees t, then will a be $= \dfrac{2ct}{r\sqrt{b}}$.

EXAMPLE.

Given $a^3 + 9a^2 = 1000$, or $a^3 + ba^2 = 4c^3$, to find a? Here $\dfrac{rb\sqrt{b}}{c} = \dfrac{r9\sqrt{9}}{\sqrt{475}}$ is $= 10.0930169$, which answers in the Tables of $x^3 - bx = 2c$, to $34^\circ : 32' : 15'' : 18'''$, whose Logarithm Tangent is 9.8377445, then will $\dfrac{2ct}{r\sqrt{b}} = 9.8377445 + 1.3383468 + 0.3010300 - 10.4771212 = 1.0000001$ be $=$ the Logarithm of a, $\therefore a$ is $= 10$, the only Affirmative, and possible Value of a; since 10.0930169 is not to be found in the Tables of $bx - x^3 = 2c$. Q. E. I.

CASE IV.

To find the Value of a *in* $ba^2 - a^3 = c$?

SOLUTION.

MAKE $ba^2 - a^3 = 4c^3$, find the Value of $\dfrac{rb\sqrt{b}}{c}$ in the Tables under $bx - x^3 = 2c$, as in *Case* II. and call the Tangent of the correspondent Number of Degrees t, then will a be $= \dfrac{2cr}{t\sqrt{b}}$.

EXAM-

EXAMPLE.

Given $20a^2 - a^3 = 1152$, or $ba, -a^3 = 4c^3$ to find a? Here $\dfrac{rb\sqrt{b}}{c} = \dfrac{r20\sqrt{20}}{\sqrt{288}}$ is $= 10.7218488$ which answers in the Tables of $bx - x^3 = 2c$ to $27°:29':38'':6'''$, and also $32°:18':41'':32'''$ whose Logarithm Tangents call t, and T, then will the Logarithm of $\dfrac{2r\sqrt{288}}{t\sqrt{20}} = 1.1638471$, and $\dfrac{2r\sqrt{288}}{T\sqrt{20}} = 1.0791812$ which answer in the Tables of Logarithms to 14.583, and 12, be the two affirmative Values of a. And if 10.7218488 be sought for in the Tables under $x^3 - bx = 2c$, we shall find it $= 40°:56':16'':33'''$, whose Tangent call t, then as in *Case* III. will $\dfrac{2t\sqrt{288}}{r\sqrt{20}}$ be $= 0.8184239$, which in the Logarithm Tables is $= 6.583$ the negative Value of a, $\therefore a = +14.583, +12$, or -6.583 for $a - 14.583 \times a - 12 \times a + 6.583$ is $= a^3 - 20a^2 + 1152 = 0$, the given *Equation*. Q. E. I.

CASE V.

To find the Value of a *in* a³+ba=c ?

SOLUTION.

PUT $a^3 + 3ba = 2c$, and find the Value of z in $z^6 - 2cz^3 = b^3$, by the foregoing new Method of solving *Quadratic Equations*, then will $z - \dfrac{b}{z}$ be $= a$.

EXAM-

EXAMPLE.

Given $a^3 + 627a = 2572$, or $a^3 + 3ba = 2c$, Quere a? Substitute the Value of $b = 209$, and of $c = 1286$ in $z^6 - 2cz^3 = b^3$, then (by *Case* II. of *Quadratics*) half the Logarithm of b^3 + Radius is $= 13.4802194$, from which subtract the Logarithm of $c = 3.1092410$, and there remains 10.3709784, which answers in the Tables of Logarithm Tangents to $66° : 56' : 40''$, the Tangent of whose Half is 9.8204170, and this taken from 13.4802194 leaves $3.6598024 =$ the Logarithm of z^3 $\therefore$ $z = 16.593 \&c.$ and $\therefore$ $\frac{b}{z} = 12.593 \&c.$ Hence $z - \frac{b}{z} = a = 4.$ The other Values of a are found by the common Method of Division, $\&c.$ to be impossible. Q. E. I.

CASE VI.

To find the Value of a *in* $a^3 + ba^2 + ga = c$ *universally?*

SOLUTION.

MAKE $a^3 + 3ba^2 + ga = c$, find the Value of z in $z^3 \begin{matrix} -3b^2z \\ +gz \end{matrix} = c \begin{matrix} +gb \\ -2b^3 \end{matrix}$ and then will $z - b$ be equal to a,

EXAMPLE I.

Given $a^3 + 3a^2 + 2a = 2184$, or $a^3 + 3ba^2 + ga = c$, to find a? Here by substituting $b = 1$, and $g = 2$, in $z^3 \begin{matrix} -3b^2 \\ +g \end{matrix} z = c + gb - 2b^3$, we get $z^3 - z = 2184$, from whence (by *Case* I. of *Cubics*) z will be found $= 13$.

Hence

Hence $z-b$ is $=a=12$, the only Affirmative, and possible Value of a. Q. E. I.

EXAMPLE II.

Suppose $a^3-6a^2+2a=888$, or $a^3-3ba^2+ga=c$, Quere a? Here because b is Negative, therefore every Term wherein there is an odd Power of b must be changed in $z^3 \genfrac{}{}{0pt}{}{-3b^2}{+g} z=c+gb-2b^3$. And

because b is $=2$, and $g=2$: Hence $z^3 \genfrac{}{}{0pt}{}{-12}{+2} z=888-4+16$ is $z^3-10z=900$, from which by *Case* I. of *Cubics*, z will be found $=10$, and here 'twill be $z+b=12$, the only Affirmative, and possible Value of a. Q. E. I.

EXAMPLE III.

If $a^3-9a^2-4a=4320$, Quere a? Here $b=3$, and $g=4$ are both Negative: Hence $z^3 \genfrac{}{}{0pt}{}{-27}{-4} z=4320+12+54$ is $z_3-31z=4386$, which being solved by *Case* I. of *Cubics*, gives $z=17$; and $z+b=20$, the (only possible) Value of a, which was requir'd.

EXAMPLE IV.

Given $-a^3+330a^2-1600a=8125$, to find a? Here by Transposition $a^3-330a^2+1600a$ is $=-8125$, where b and c are both Negative: Hence by Substitution $z^3 \genfrac{}{}{0pt}{}{-36300}{+1600} z=-8125-176000+2662000$ becomes $z^3-34700z=2477875$, which being solv'd by our Method, z will be found $=215$, and $\therefore z+b$ is $=325$; but z will be also found $=101.91$, $\therefore b-z$ is $=8.09$ the two Affirmative Values of a. Lastly, z will be found too $=113.09$, $\therefore z-b$ is $=3.09$ the Negative Value. Q. E. I.

Having

Having now sufficiently exemplified these new Tables in the Solution of the preceding *Cases*, we come next to their Demonstration.

The Demonstration of the foregoing CASES.

IN the Triangle *ABC*, right angled at *B*, let the Difference betwixt *AC* and *BC* be called *d*; the double Area of the Triangle *ABC*, *A*; and *AB* be $=$ *a*, then by a Process in Algebra we get $a^3 - d^2a =$ 2*dA*; but if the Sine and Cosine of the Angle *BAC* be express'd by *x* and *y* respectively, Radius being $= 1$; we have *(per Trigonometry)* $y : a :: x :$ $\frac{ax}{y} = BC$, $\therefore \frac{aax}{y} = A$; again, $y : a :: 1 : \frac{a}{y} = AC$;
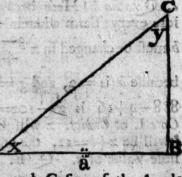

hence $\frac{a}{y} - \frac{ax}{y} = d$, $\therefore a = d \times \frac{y}{1-x}$ and $a^2 = d^2 \times$

$\overline{\frac{y}{1-x}}\Big|^2$ which put for a^2 above makes $d^2 \times \overline{\frac{y}{1-x}}\Big|^2 \times$

$\frac{x}{y} = A$, $\therefore \overline{\frac{y}{1-x}}\Big|^2 \times \frac{x}{y} = \frac{A}{d^2} =$ to the Square of the Cotangent of half the Angle *ACB*, drawn into the Cotangent of the whole Angle *ACB*.

Again, If *s* be put for the Sum of *AC* and *CB*; then by a like Process we get $s^2 a - a^3 = 2sA$; $a = s \times$

$\frac{y}{1+x} = s \times \frac{1-x}{y}$ and $\frac{A}{s^2} = \overline{\frac{1-x}{y}}\Big|^2 \times \frac{x}{y} =$ to the Co-

tangent of the Angle *ACB*, divided by the Square of the Cotangent of its half.

COROL-

COROLLARY I.

Hence the Demonstration of the Calculus of the Tables: For if we take the Angle $ACB = 10°$, then will the Logarithm Tangent of $90° — 10° = 80°$ being made more, and less, by the Double of the Logarithm Tangent of $40°$ give the Value of $\overline{\dfrac{y}{1-x}}\Big|^2 \times \dfrac{x}{y} = \dfrac{A}{d^2}$; and $\overline{\dfrac{1-x}{y}}\Big|^2 \times \dfrac{x}{y} = \dfrac{A}{s^2}$; the former of which is 10.6013082 placed under $x^3 — bx = 2c$; and the latter is 10.9060542 placed under $bx — x^3 = 2c$; against $40°$ in our Tables, and so for any other Degree, &c. Q. E. D.

COROLLARY II.

Hence the Demonstration of the 1st *Case* of *Cubics*, viz. $a^3 — ba = 2c$, or $a^3 — d^2 a = 2dA$, by the Help of these Tables may be deduc'd; for $d^2 = b$, and $2dA = 2c$ ∴ $d = \sqrt{b}$, $c = \sqrt{b} \times A$, and $A = \dfrac{c}{\sqrt{b}}$, but before $\dfrac{A}{d^2}$ was found $= \overline{\dfrac{y}{1-x}}\Big|^2 \times \dfrac{x}{y} =$ here to $\dfrac{c}{b\sqrt{b}}$, or rather $\overline{\dfrac{1-x}{y}}\Big|^2 \times \dfrac{ry}{x} = \dfrac{rb\sqrt{b}}{c}$ (supposing $r =$ Radius) being more ready in Practice, is $=$ to the Degrees in the Tables under $x^3 — bx = 2c$, whose Tangent let be t, then because 'twas before prov'd that $d \times \dfrac{y}{1-x}$ was $= a$, and here d being $= \sqrt{b}$, and $\dfrac{y}{1-x} = \dfrac{y}{r-x}$ is $= \dfrac{r+x}{y} =$ the Co-tangent of half the Angle $BCA =$ also to $\dfrac{r}{t}$ ∴ a is $= \dfrac{r\sqrt{b}}{t}$. Q. E. D.

COROL.

COROLLARY III.

Hence also the Demonstration of the 2d *Case* of *Cubics*, viz. $ba - a^3 = 2c$ or $s^2a - a^3 = 2sA$, for by proceeding, as in last *Corollary*, we get $s = \sqrt{b}$, and $\dfrac{A}{s^2} = \dfrac{c}{b\sqrt{b}} = \overline{\dfrac{1-x}{-y}}\Big|^2 \times \dfrac{x}{y}$, or rather $\overline{\dfrac{y}{1-x}}\Big|^2 \times \dfrac{ry}{x} = \dfrac{rb\sqrt{b}}{c}$ is $=$ to the Degrees in the Tables of $bx - x_2 = 2c$, whose Tangent call t, then because 'twas before prov'd that $sx\dfrac{y}{r+x}$ was $= a$, and here s being $= \sqrt{b}$, and $\dfrac{y}{r+x} = \dfrac{t}{r}$, $\therefore a$ is $= \dfrac{t\sqrt{b}}{r}$. Q. E. D.

The Demonstrations of the other *Cases* are easily prov'd from what has already been deliver'd, except that of the 5th *Case*, which is deduc'd from the Rule commonly ascrib'd to CARDAN.

CHAP. III.

Of the Resolution of Biquadratic Equations.

ALL Sorts of Biquadratic Equations may be solv'd by the Intervention of Cubic ones, thus :

RULE.

Let the Equation propos'd to find the Values of a, be $a^4 + qa^3 + ra + s = 0$, (whose second Term is taken away) find first the Root of this Cubic Equation $x^3 + 2q\,x^2 \genfrac{}{}{0pt}{}{+q^2}{-4s} x - r^2 = 0$ by the foregoing new Method, then making $\sqrt{x} = e$, $\dfrac{q + e^2 - \frac{r}{e}}{2} = c$, and

$q +$

$\dfrac{q+e^2+\frac{r}{e}}{2} = d$; and the original Equation will be resolv'd into these two Quadratics, *viz.* $a^2+ea+c=0$, and $a^2-ea+d=0$, each of which being solved by the new Method of Quadratics, will exhibit the Value of a requir'd.

DEMONSTRATION.

Let the two Quadratic Equations $a^2+ea+c=0$, and $a^2-ea+d=0$, whose middle Terms $+ea$, and $-ea$, are equal, and contrary, be multiplied together, and there will result a Biquadratic Equation, whose second Term is wanting; for they will produce

$$a^4 \overset{+c}{\underset{-e^2}{+d}} a^2 \overset{+ed}{\underset{-ec}{\ }} a+cd=0,$$

which put $=$ to the given Equation $a^4+qa^2+ra+s=0$; from whence we have $c+d-e^2=q$, $ed-ec=r$, and $cd=s$, $\therefore d+c=q+e^2$, and $d-c=\dfrac{r}{e}$; and by adding and subtracting these, and taking the half of each, we get $c=\dfrac{q+e^2-\frac{r}{e}}{2}$ and $d=\dfrac{q+e^2+\frac{r}{e}}{2}$. Multiply these two together, and we have

$$\dfrac{q^2+2qe^2+e^4-\frac{r^2}{e^2}}{4} = dc,$$

which is $=s$, then by Reduction we get $e^6+2qe^4+\overset{+q^2}{\underset{-4s}{\ }}e^2-r^2=0$: Put $x=e^2$, and the Bicubic will become $x^3+2qx^2+\overset{+q^2}{\underset{-4s}{\ }}x-r^2=0$, from whence the Rule is evident. Q. E. D.

Example I.

Given $-a^4+27a^2+14a=120$, to find a? By transposing the Equation, 'tis $a^4-27a^2-14a+120=0$, or $a^4+qa^2+ra+s=0$ ∴ $q=-27$, $r=-14$, and $s=+120$, and by substituting these Values in $x^3+2qx^2+\dfrac{+q^2}{-4s}x-r^2=0$, we have $x^3-54x^2+\dfrac{+729}{-480}x-196=0=x^3-54x^2+249x-196=0$, which Equation being solv'd by *Case* VI. of *Cubics*, gives $x=1$, 4, or 49, ∴ e is $=1$, 2, or 7, either of which Numbers being put for e, in $\dfrac{q+e^2-\frac{r}{e}}{2}$ and $\dfrac{q+e^2+\frac{r}{e}}{2}$ will give c, and d; for which put their Equals in $a^2+ea+c=0$, and $a^2-ea+d=0$, and find the Affirmative and Negative Roots of a in each of these Quantities, (according to the foregoing Methods) and those shall be the Values of a in the original Equation: Thus if e be taken $=1$, then is $c=-6$, and $d=-20$ ∴ $a^2+a=6$ and $a^2-a=20$, which two Equations being solv'd, the former gives $a=+2$, or -3, and the latter $a=+5$, or -4, which are the true Roots of the given Equation for $\overline{a-2}\times\overline{a+3}\times\overline{a-5}\times\overline{a+4}$ is $=a^4-27a^2-14a+120=0$. Q. E. I.

A Remark.

Here by the Bye, it may be observed, that in any Equation, whose second Term is wanting, all the Affirmative Roots taken together, are equal to all the Negative ones taken together; as in the last Example $+2$, $+5$, is $=-3$, -4. And in the first *Case* of *Cubics*, the Roots of a in $a^3-148a=672$, were found $=+14$, -8, and -6, where $+14=-8$, -6. And so in *Case* II. where $364a-a^3=2640a$ was found $=+10$, $+12$, and -22; all which prove the Truth of this Remark.

Ex-

Example II.

Given $a^4 - 60a^3 + 1650a^2 - 22500a + 115344 = 0$, Quere a? In order to take away the second Term, substitute $y + 15$ instead of a in the Equation, and it will be converted into $y^4 + 300y^2 - 2781 = 0$, which is a Quadratick Equation; $\therefore$ being solv'd by *Case* I. *p.* 2. we get $y^2 = 9$, (or -309 impossible;) and consequently a, one of it's requir'd Values, is 18, because $a = y + 15$: now let the given Equation be divided by $a - 18$, and we have $a^3 - 42a^2 + 894a - 6408 = 0$, from which by *Case* VI. of Cubics, a will be found $= 12$, the other Values being found to be impossible.

But if the Solution of the Quadratic Equation $y^2 + 300y^2 = 2781$ be justly consider'd, it will evidently appear, that y may be as well -3, as $+3$, since either of them involv'd will form the Equation, $\therefore$ a will then be found either $3 + 15$, or $+15 - 3$, $= 18$, or 12, at once.

But let $y^4 + 300y^2 - 2781 = 0$, be an Equation to be resolv'd by the general Rule, where q is $= 300$ $r = 0$, and $s = -2781$: Here their Cubic Equation, first to be solv'd, is $x^3 + 600x^2 + 101124x - r^2 = 0$, or because $r^2 = 0$, 'twill be $x^3 + 600x^2 + 101124 x = 0$; now as x is found in every one of the Terms, it is an infallible Rule that one of its Values is $= 0$, $\therefore$ dividing the Equation by x, to discover the other Roots, we have this impossible Equation $x^2 + 600x + 101124 = 0$, and $\therefore$ there is but one Value of x or ee, which is $= 0$: Seeing $ee = 0$, the Quantities c and d will then be $\dfrac{q - \frac{r}{e}}{2}$ and $\dfrac{q + \frac{r}{e}}{2}$, and the Difficulty now lies in finding the Value of $\dfrac{r}{e}$, whose Terms are both equal to nothing; for tho' r and e

may

may be equal to nothing, when confider'd in Conjunction with finite Quantities, yet, when compar'd one with another, they may be in any Ratio. Therefore to forward our Enquiry, fays Dr. *Saunderson*, fuppofe the Quantities r and e to be finite, and to pafs in a finite Time from fomething thro' all Degrees of Magnitude into nothing, fo as to vanifh both togecher, and fo difcover, if we can, the ultimate Magnitude of the Fraction $\frac{r}{e}$; to this End, let us refume the Equation $x^3 + 600x^2 + 101124x - rr = 0$, that expreffes the Relation of r to e, or rather of r to x in general, whether it be finite or infinitely fmall, where, by x muft be underftood the leaft Root of it: Now by this Equation it is plain that when r is fomething, or nothing, x will be fo too, $\therefore$ they will both vanifh togecher: It is plain alfo, that when x is nothing, or rather in its laft State of Exiftence, the firft Term x^3 will be infinitely lefs than the fecond $600x^2$, becaufe x which is nothing is infinitely lefs than 600, which is fomething: For the fame Reafon $600x^2$ will be infinitely lefs than $101124x$; $\therefore$ the two laft Terms of the Equation will give the laft Relation of r to x as effectually as the whole: Reject then the two firft Terms, and we fhall have $101124x - rr = 0$, $\therefore x = \frac{rr}{101124}$, and $\sqrt{x}$, or $e = \frac{r}{318}$; thus then the laft Ratio of r to e, is that of r to $\frac{r}{318}$, or of 318 to 1, and the laft Magnitude of $\frac{r}{e}$ is $\frac{318}{1}$ or 318: This being known, we fhall have $q = \frac{r}{e}$ or $c = -9$, and $\frac{q + \frac{r}{e}}{2}$ or $d = +309$, and

and the Equations derived from this Suppoſition $e = o$ will be $yy - 9 = o$, and $yy + 309 = o$. ∴ $yy = 9$ and $y = \sqrt{9} = 3$, or -3, the other Value of y being impoſſible, &c. Q. E. I.

It is not without the utmoſt Pleaſure and Sur-prize (proceeds the Doctor) that I obſerve, what admirable Shifts Nature has to bring herſelf off upon all Occaſions when ſhe ſeems to be ſurrounded with inſupportable Difficulties ; Shifts ſo far be-yond all human Contrivance, that it is not always in the Power of human Underſtanding to trace out her Steps, and follow her, much leſs to preſcribe to her : But the ſublimer Parts of Mathematics, and more particularly the Doctrine of *Fluxions*, fur-niſh us ſtill with more frequent and pregnant In-ſtances of this Kind, inſomuch that the ancient Sage (whether he knew it or not) had a great deal of Reaſon on his Side, when he cried out as he did,

Magna eſt veritas, & prævalebit.

Having now finiſh'd the Buſineſs of ſolving *ad-fected Equations*, and, I hope, made every Thing ſufficiently plain, give me leave to apply theſe *Tables* to the Solution of the two Queſtions men-tion'd in the *Preface*, and I have done.

QUES-

QUESTION I.

In any right-angled Triangle, the Area = 294, and the Difference between the Hypothenuse and Perpendicular = 14, being given; to find all the other Parts of the Triangle by a Simple Equation.

SOLUTION.

PUT $2A$ = twice the Area = 588, d = the Difference, &c. = 14, T = the Tangent of the Angle BCA, (See Fig. p. 14.) t = Tangent of half the Angle BCA, Radius = 1, and $a = AB$; then (*per Trigonom.*) as $T : 1 :: a : \frac{a}{T} = BC$, $\therefore AB \times BC = 2A$, is $\frac{aa}{T} = 2A$, and $\therefore a^2 = 2AT$. Again (*per Theorem page 38. line 17. of* Mr. THACKER's MISCELLANY, &c. $\frac{2t}{1+t^2}$ = Sine of the Angle BCA, and $\frac{1-t^2}{1+t^2}$ = its Cosine, *viz.* the Sine of the Angle BAC,) we have $\frac{2t}{1+t^2} : a :: \frac{1-t^2}{1+t^2}$: $\frac{a-t^2a}{2t} = BC$, and $\frac{2t}{1+t^2} : a :: 1 : \frac{a+t^2a}{2t} = AC$, $\therefore AC - BC = d$ is t $\therefore a = \frac{d}{t}$, and $aa = \frac{d^2}{t^2}$, which being wrote for aa above, makes $\frac{d^2}{t^2} = 2AT$ $\therefore d^2 = 2ATt^2$ and $\therefore \frac{d^2}{2A} = Tt^2$, in Logarithms $\frac{d^2}{2A}$ is = 9.5228787, which answers in the Tables of Tt^2 (or $x^3 - bx = 2c$) to $26° : 33' : 54'' : 19'''$ = half the Angle,

Angle BCA, $\therefore a = \dfrac{d}{t} = 28 = AB$, and $\dfrac{2A}{a} = 21$ $= BC$, confequently $AC = 35$. Q. E. I.

QUESTION II.

In any right-angled Triangle, the Area and the Sum of the Hypothenufe, when added to either Side, being given, thence to find the Sides, &c. (*See* Ward, &c. P. 326.)

SOLUTION.

SUPPOSE $AB \times BC = 2A = 2700$, and $AC + BC = s = 120$, to find the Sides. (*See Fig. pag.* 14.) By proceeding to find BC and AC, as in the laft Queftion, we fhall get $s = \dfrac{a}{t}$ $\therefore a = ts$, and $a^2 =$

$t^2 s^2$ $\therefore$ $t^2 s = 2AT$, and $\therefore$ $\dfrac{s}{2A}$ (in Logarithms) is

$= \dfrac{T}{t^2} = 10.7269986$, which anfwers in the Tables of

$\dfrac{T}{t^2}$ (or $bx - x^2 = 2c$) to $26° : 33' : 54'' : 19''$, $\therefore a =$

$ts = 60 = AB$, and $\dfrac{2700}{60} = 45$ is $= BC$, and confe-quently AC is $= 75$. Q. E. I.

But 10.7269986 anfwers in the Tables of $\dfrac{T}{t^2}$

to $33° : 4' : 47' : 14''$ alfo, $\therefore$ we have 78.1667 for another Value of a, and $\dfrac{2700}{78.1667} = 34.54156$

is $= BC$, and confequently AC is $= 85.45844$, which will alfo anfwer the Conditions of the Queftion.

$\therefore$ Becaufe $a^2 = 2AT$. See the other Solution.

Now

Now if the Cubic Equation given by *Ward*,
viz. 14400 *a*—*a*³=648000 be solv'd by *Case* II.
pag. 8. we shall find the Values of *a* to be + 60,
and +78.1667 the same as before, and ∴ the Sum
of those two Affirmative Values, with a contrary
Sign, will be = — 138.1667 the Negative one,
by Remark *pag.* 18.
